A review of the distribution and population of the Collared Crow Corvus torquatus

PAUL J. LEADER, DAVID J. STANTON, RICHARD W. LEWTHWAITE & JONATHAN MARTINEZ

Abstract: The Collared Crow *Corvus torquatus* is a species largely restricted to China and is currently listed as Near Threatened. This paper reviews historical changes in the distribution of Collared Crow in China and, based on modern records from China, Vietnam and Taiwan, provides the first systematic global population estimate for the species. Based on field surveys in Guangdong province, China, during 2003–2014, evidence is presented that shows it is absent from vast areas of habitat suitable for the species in that province and indicates that a previous population estimate made in 2007 by BirdLife International, based on an extrapolation of numbers from one of its strongholds in Hong Kong, is flawed. A revised population of less than 2,000 individuals is substantially less than the 15,000–30,000 previously estimated, and it is recommended that the species be uplisted to Vulnerable.

INTRODUCTION

The Collared Crow *Corvus torquatus* is found mainly in the People's Republic of China, being resident in the south and east, reaching southern Hebei in the north-east, Gansu in the west and Yunnan and Hainan in the south-west (Cheng 1987, BirdLife International 2016). Outside mainland China, it is known only from northern Vietnam and Taiwan, where it is restricted to Kinmen Island (just off the coast of mainland China) and the main island of Taiwan, where it is accidental (Brazil 2009, BirdLife International 2016). It is currently listed as Near Threatened on the basis that the global population is experiencing a moderately rapid and ongoing decline (BirdLife International 2016).

This paper reviews the historical distribution of the species and presents an up-to-date summary of its distribution and population.

METHODS

Historical literature review (1855–1980)

The authors carried out an extensive review of the historical literature (including Chinese ornithological literature) on the distribution and population of the Collared Crow in China from 1855 to 1980, commencing with Robert Swinhoe's first records from China to the end of the period covered by Cheng (1987).

Review of recent records (2003-2014)

Records of Collared Crow for the period from 2003 to 2014 were collated. These were sourced from the published literature; from online requests for records from Birdforum (http://www.birdforum.net/showthread.php?t=288068), ChinaBirdnet.com and Oriental Birding (orientalbirding@yahoogroups.com); from online databases BirdTalker (http://birdtalker.net) and eBird (http://ebird. org); and from direct requests for information. Where necessary, observers of online records were contacted to request permission to publish their data. If this could not be obtained such records were summarised and the reader is referred back to the original source. Where a number of birds was given as a range (e.g. 10–20), the lower figure was used. From these records the highest count from each site was taken and these were summed to arrive at a total population estimate.

Surveys in Hong Kong, Macau and Guangdong province Field surveys were carried out in the Hong Kong Special Administrative Region (hereafter Hong Kong), the Macau Special Administrative Region (hereafter Macau) and Guangdong province during the period 2003–2014; additional data were sourced from other reliable observers. Surveys were carried out using a 5 × 5 km

square grid based on that used for Hong Kong (see Carey et al. 2001). Within each square a minimum of two hours continuous observation was spent in suitable habitat. The Collared Crow is known to prefer low-lying areas, and shows a very strong association with wetlands including agricultural areas (particularly rice fields), riverine plains, lightly wooded country near water or marshes, fishponds and coastal areas (including mudflats, rocky and sandy shores). It generally avoids more heavily wooded or hilly country and developed areas such as parks, gardens and towns (Madge & Burn 1994, Carey et al. 2001, Carey 2009, BirdLife International 2016, Madge 2016). The survey methodology was fluid to allow for differences in terrain and infrastructure, but generally followed roads and paths with prolonged scans of open country, estuaries, beaches and mudflats as required. Areas of potentially suitable habitat were identified through a combination of local knowledge, a review of maps and/or aerial images, and cold searching. Although the survey period was long (12 years), which could potentially lead to an over-estimate of the number of individuals present, given the low numbers recorded during the surveys any over-estimate is not considered significant.

RESULTS

Historical literature review (1855-1980)

The Collared Crow was formerly common and widespread on the coast and in the lowlands throughout much of southern China, south to Hainan and west to central Guangxi; its distribution also extended north to Beijing and west to northern Shaanxi, west Sichuan and eastern Yunnan (Appendix 1). Armand David, who travelled widely in the north, west and south of China between 1862 and 1874, considered it 'one of the most characteristic birds of the Chinese avifauna ... particularly widespread in southern provinces ... sedentary' (David & Oustalet 1877).

Other authors who provided first-hand accounts of the species in southern China between the 1850s and 1930s also regarded it as resident and without exception used terms such as 'common', 'very common', 'frequently occurs', 'often met with', 'abounds', 'large numbers' or 'assembling by the hundreds' when describing its abundance. The localities referred to included Xiamen, Fujian, in the 1850s (Swinhoe 1860); Hong Kong, Guangzhou and Macau in 1860 (Swinhoe 1861a); the lowlands of north and north-west Hainan in 1868 (Swinhoe 1870); the entire Lower Yangtse basin from eastern Hubei to the delta in the 1880s (Styan 1891); Fuzhou and Shantou on the Fujian–Guangdong coast in the 1880s and 1890s (La Touche 1892, Streich 1903, La Touche & Rickett 1905); Zhenjiang, Jiangsu in the early 1900s (La Touche 1906–1907); Hong Kong, Macau, the Pearl River Delta, the North River north to Shaoguan, and the West River from the Pearl River Delta through western Guangdong to central Guangxi in the years 1900–1908 (Vaughan & Jones 1913); Shasi, Hubei in 1917–1919 (La Touche 1922); Jiangsu and Anhui south of the Yangtse in 1921–1922 (Koltoff 1932); the lowlands of Guangxi in the years 1927–1931 (Yen 1933–1934); Nanjing, Jiangsu in 1930 (Ascherson 1930); Zhejiang in the early 1930s (Shaw 1934) and north and south-west Guangdong in the early 1930s (Yen 1932, Jabouille 1935). The above accounts paint a consistent picture of a common and widespread species.

Its abundance on the South China coast and along the Yangtse was not matched at Shanghai, where it was only found occasionally (Sowerby 1943). North of the Yangtse River, it was recorded in Beijing in 1860 and 1900–1901 (Swinhoe 1861b, 1863, Walton 1903), Sichuan in 1868–1869 (David 1871), Hebei at least up to the 1920s (Wilder & Hubbard 1924), Shandong in the 1920s (LeFevre 1962), Henan in the 1930s (Fu 1937), Shaanxi in 1957–1958 (Cheng *et al.* 1962), and on unknown dates in Shanxi, Gansu, Guizhou and north-east Yunnan (Cheng 1987). Except in Henan, where Fu (1937) stated that it was common on the plains, it was generally considered to be much less common in the north of its range than in the south.

In the late 1950s, when the study of birds resumed following a period of invasion and civil war, ornithology in China was largely concerned with ascertaining whether a particular species was harmful or beneficial to farming and forestry, and the status and distribution of the Collared Crow was much less clear. However, the fact that the stomach contents of 63 Collared Crows were analysed in one study alone in Fujian in 1957 (Cheng 1963), indicated that the species was still present in good numbers locally in China in the late 1950s. Review of recent records (2003-2014)

Records were collated from mainland China, Taiwan and Vietnam for the period 2003–2014. The peak count from each individual site was taken and summing these counts provides population estimates of 1,709 individuals for China, 18 for Taiwan and 120 for Vietnam, a total of 1,847 individuals. The locations of records are shown in Figure 1 and summarised in Table 1 and a detailed breakdown of the records is provided in Appendix 2. The provinces/municipalities in China with the largest populations were Henan (451 individuals), Hong Kong (362), Hubei (223), Anhui (170) and Zhejiang (146). In Taiwan it was restricted to Kinmen Island (about 25 km east of the coast of mainland China) with a population estimate of 18 individuals. In Vietnam 120 individuals were reported from Cao Bang province.

The distribution pattern broadly matches that in the published literature, covering an area of 2,400,000 km² (excluding isolated records from Beijing and Hebei which were considered by the observers to be wandering individuals). Of particular note were the numbers from the Dabie Shan in central China. Large numbers were reported from Shangcheng, Gushi and Huaibin counties, Henan province, between 4–10 December 2014, with an estimated 400–500 individuals in a total of more than 7,000 crows, including Carrion Crow C. corone, Large-billed Crow C. macrorhynchus, Daurian Jackdaw C. dauuricus and Rook C. frugilegus. Interviews with local villagers revealed that Collared Crows were very common in the area (Henan Wild Bird Society in litt. 30 January 2015). The Dabie Shan range covers Henan, Hubei and Anhui provinces (Figure 1) and Liu et al. (2008) listed Collared Crow from all three areas during 2004–2006. Based on the data presented here, 525 birds were recorded in the Dabie Shan—Henan (412), Hubei (109) and Anhui (4). These records indicate that the Dabie Shan

Figure 2. The distribution of Collared Crow records in Guangdong, Hong Kong and Macau 2003–2014 (the grid is 5 km × 5 km and the presence or absence of Collared Crows is shown).

is currently the most important stronghold for the species with about 30% of the total population, followed by Hong Kong with about 20%.

Surveys of Hong Kong, Macau and Guangdong province In total 714 squares $(5 \text{ km} \times 5 \text{ km})$ were surveyed in Guangdong (605), Macau (3) and Hong Kong (106). Of the 21 prefectures in Guangdong province 17 were surveyed, and 9% of all squares in Guangdong, Macau and Hong Kong were surveyed. The results of the surveys are summarised in Table 2, and the squares surveyed shown in Figure 2. In Guangdong the species was recorded from 12 squares, of which 10 were in Shenzhen (immediately to the north of Hong Kong) and the others were from Yangjiang county (four individuals) and Huizhou county (a single bird). Records in Shenzhen and Huizhou county came from large reservoirs surrounded by orchards or shrubland. The four birds in Yangjiang county were on a small cultivated plain with extensive rice fields. The plain itself was surrounded by low (100–300 m) hills, mostly covered by shrubland and small orchards. It is noteworthy that such habitats were regularly encountered in other areas, but no Collared Crows were found.

In Hong Kong it was recorded from 38 of the squares surveyed, and there were no records from Macau.

DISCUSSION

The findings presented here give a clear picture of the decline of the Collared Crow. The current situation in Guangdong province, where it was once clearly much more common and widespread (see Appendix 1), is indicative of a major decline in both abundance and distribution. There are clear indications of similar declines in other provinces, notably Chongqing, Fujian, Hainan (where it was last recorded in 1963), Hebei, Jiangsu, Macau and Shaanxi. There are no recent records from Shandong, Shanghai, Shanxi and Tianjin, hence, although the historical literature suggests it was never common in these provinces, this would indicate a reduction in the range of the species.

The revised population estimate presented here of less than 2,000 individuals is substantially lower than the current population estimate of 15,000-30,000 individuals (BirdLife International 2016). This estimate was largely based on the assumption that its distribution and abundance in Hong Kong is mirrored across the rest of its range (S. Chan in litt. 2007, BirdLife International 2016), and whilst it could be argued that there are populations which remain to be discovered, given that this is a large, readily identifiable, open-country species it is considered untenable that a further 13,000–28,000 have been overlooked. In Guangdong it was recorded in 12 (2%) of 605 squares surveyed, with 15 individuals recorded, whereas in Hong Kong 362 individuals were recorded in 38 (36%) of 106 squares surveyed. Large areas of Guangdong not surveyed consist of extensive tracts of habitat unsuitable for this species and, although not included in the surveys described here, the hills and forests of Guangdong are relatively well surveyed and there are very few records from these areas. In a comprehensive review of birds at nine forest sites in south-east China between 1984 and 1996, Lewthwaite (1996) reported the species from only one site, Ba Bao Shan, in Guangdong, where up to three were seen at 600 m on two dates in June and December. This situation was confirmed by Lee et al. (2006) who did not record Collared

Crow in surveys of 54 forest areas in southern China, including Guangdong. More significantly, Zou & Ye (2016), in a review of all historical records for Guangdong province, listed it from only 15 locations: Guangzhou, Shaoguan, Shenzhen (four sites), Zhuhai, Shantou, Zhaoqing, Huizhou, Meijing River, Heyuan, Yangjiang, Qingyuan and Yanfu City.

It is of note that in contrast to the Collared Crow, the Large-billed Crow remains a common and widespread species in Guangdong province (pers. obs.). This is thought to be due to differences in habitat preference, with Large-billed Crow found mostly in hill forest whereas Collared Crow occurs largely in the lowlands, which inevitably brings it close to human habitation, thus making it more vulnerable to persecution and secondary poisoning.

Corvid populations typically include a proportion of nonbreeding birds and, whilst the breeding ecology of Collared Crow is little-known, studies of similar species such as Carrion Crow and American Crow *C. brachyrhynchos* indicate that breeding commences when birds are two years old and that a high proportion of the populations of both species are non-breeding birds (Roselaar 1994, McGowan 1997). Estimates of the proportion of non-breeding birds in Carrion Crow populations include 77% in Sweden, 50–73% in Scotland and 40% in France; however, the proportion of nonbreeding birds could be even higher than this as non-breeding birds are known to form scattered flocks and even hold territories (Roselaar 1994). Detailed surveys at a roost at Mai Po Nature Reserve, Hong Kong, indicate that between 49–91% of the population remain in communal roosts over the breeding season (Stanton *et al.* in prep.) and are therefore presumably non-breeding birds. Based on the population estimate in Table 1, and taking an indicative range of 40-80% as a guide for the probable proportion of non-breeding birds in Collared Crow populations, the number of mature individuals (20-60% of the population) would be in the range of 400-1,100 birds. This is substantially lower than the estimate of 10,000-19,999 mature individuals provided by BirdLife International (2016).

The exact timing of the decline in Collared Crow numbers in China is difficult to pinpoint. However, it is likely that major changes in agricultural practices in the 1950s have contributed significantly and, whilst current threats are unclear, it is assumed that loss of food supply owing to agricultural intensification and an associated over-use of pesticides remain major problems. The low numbers in Guangdong province relative to the numbers in Hong Kong would indicate that this is an ongoing constraint. Persecution in some areas by humans is a casual factor (BirdLife International 2016, Madge 2016) and it is traded at markets in southern China, although the scale of such trade is unknown (Kadoorie Farm & Botanic Garden 2004). However, some declines are much more recent. For example, at Kinmen Island, Taiwan, up to 176 individuals were recorded in 1989 but it has declined significantly since then (BirdLife International 2016) to a current population of about 18 individuals (Table 2). Based on the findings of this study, this alone accounts for a decline of about 8% in the world population.

Conservation status

As noted above, both the population estimate and number of mature adults given by BirdLife International (2016) are considered to be major over-estimates and a review of the threat status for Collared Crow is required. Applying IUCN Red List criteria, the number of mature individuals is probably best placed in the 2,500– 10,000 range. It is difficult to clearly determine subpopulations

Table 2. Summary of coverage and results of surveys conducted inGuangdong province, Macau and Hong Kong 2003–2014.

Prefecture/Administrative Region	No. of 5 km squares surveyed	No. of 5 km squares in which Collared Crows were recorded	Total no. of individuals recorded
Guangzhou	34

Total	714	50	382

and it could be argued that, given the lack of geographical barriers, the species should be treated as one subpopulation linked by dispersal. With less than 10,000 individuals, a continuing decline, and all mature individuals in the same subpopulation, it would therefore qualify as Vulnerable under C2(a)(ii). As such it is proposed that Collared Crow be uplisted from Near Threatened to Vulnerable.

Further research

There are clearly major gaps in our understanding of the ecology of Collared Crow and a more detailed understanding of habitat requirements (beyond a preference for wetlands) and the breeding ecology of the species are required. In particular, studies of the age of first breeding and proportions of non-breeding birds are critical to an adequate assessment of its status. Further surveys in the Dabie Shan to investigate seasonal variation in numbers and habitat utilisation are recommended. Surveys in northern Vietnam looking for additional sites for the species are also recommended. Finally, communal roosts in Hong Kong have been counted on a systematic basis for a number of years and such counts enable longterm population trends to be assessed (Stanton *et al.* 2014); studies of similar roosts elsewhere would be welcome.

ACKNOWLEDGEMENTS

We thank the following: for help with locating books and papers, F. E. Warr and Alison Harding (BMNH), Linda Birch (Edward Grey Institute, Oxford University) and Inter-Library Loan staff (Chinese University of Hong Kong); for help with translation from Chinese, Y.-L. Mo-yung and Grace Yang. Thanks to Katherine Leung for help with obtaining information through ChinaBirdnet, Tommy Hui for help with collation and translating website data, and Jenny Hui and Lag Wan for help with mapping. Jonathan Eames and Pan Chih Yuan provided details of sightings in Vietnam and Taiwan respectively, and Rob Martin provided helpful feedback on a draft manuscript. Finally, this paper would not have been possible without the contributors who have provided records as detailed in Appendix 2.

Historical distribution of Collared Crow in China and Taiwan 1855–1980.

Overview

David & Oustalet (1877) noted 'This crow is one of the most characteristic birds of the Chinese avifauna. It is found in all parts of the Chinese Empire outside the mountainous zone, but it is particularly widespread in southern provinces. It lives in pairs in paddyfields and in the vicinity of watercourses, and hardly ever ventures into the interior of villages like its congeners. It is a sedentary species'.

Styan (1891) commented 'A very common resident [in the Lower Yangtse Basin in the 1880s]... Generally seen singly or in pairs, but in winter a number will sometimes congregate together. When out shooting I have been followed for a long distance by at least thirty of them hovering close overhead, attracted by my dog. They will sometimes follow one thus for a mile'.

Note: Styan's recording area 'the Lower Yangtse Basin' extended over the final 1,000 km of the Yangtse River's course between Wuhan and the Delta, including parts of southern Hubei, northern Jiangxi, southern Anhui, southern Jiangsu, northern Zhejiang and Shanghai.

Ascherson (1930) commented that 'All the way up the Yangtze and in the country around Nanking [Nanjing], one is amazed at the numbers and conspicuousness of the nests of the Magpies, Collared Crows and Black-eared Kites'.

Distribution by province

Localities and dates of *Specimens* listed in this section are as enumerated in the literature and/or listed in museum collections. Acronyms for museums are as follows:

NHMUK – Natural History Museum, Tring, UK

MCZ - Museum of Comparative Zoology, Massachusetts, USA

ZMB – Universitat Humboldt, Museum für Naturkunde, Berlin, Germany RMNH – Naturalis Biodiversity Center, Leiden, Netherlands

Anhui

Abundance/distribution:

Koltoff (1932): 'Common [in eastern Anhui in 1922]. Two pairs bred near Chuchow [Chuzhou].'

Chong (1936): 'The Collared Crow is commonly resided on the plain or low-hills [in southern Anhui in the 1930s].' *Specimens*:

Huang Shan, September 1933 (Chong 1936); Jinhuashan, 25 October 1948 (Cheng 1960).

Beijing

Abundance/distribution:

Swinhoe (1861b): 'I occasionally saw this species [between Tianjin and Beijing in 1860]'.

Walton (1903): 'In the middle of August [1900], when I reached Peking, there were very few of these handsome crows; from October onwards they arrived in large numbers, and were quite common during the winter.' Hemmingsen & Guildal (1968):'Both in winter and summer [in the 1940s] adults and young are met with in small numbers near water'.

Piechocki (1958): 'I saw them in the rice fields at the beginning of May [1956]'.

Fiebig (1983): Three active nests found in the Summer Palace grounds, 14 April 1977.

Specimens:

14 January 1898 (MCZ); 3 January 1957, 12 and 25 November 1958, 10 September 1961 (Cao 1987).

Chongqing

Abundance/distribution:

Morrison (1948): 'A common bird everywhere [the city of Chongqing and hills 50 km to its north in the years 1943–1945], but generally seen in the hills in pairs'.

Specimens:

Changshou, 4 April 1908 (MCZ); Chongqing, May 1930 (Shaw 1932).

Fujian

Abundance/distribution:

Swinhoe (1860): 'The common crow [at Xiamen in 1855–1859] ... a permanent resident'.

La Touche (1892): 'Common and resident [at Fuzhou in the late 1880s]'. La Touche & Rickett (1905): 'The common crow [at Fuzhou in the late 1890s] ... an early breeder'.

Caldwell & Caldwell (1931): 'This is the well known Parson Crow of the plains. It may be seen singly or in colonies practically everywhere [in southern Fujian in the 1920s]. It abounds in newly ploughed fields and partly flooded regions ... It is a common scavenger along rivers. At all times the crows are sociable, but in winter doubly so, assembling by the hundreds at some common roosting place'.

Cheng (1936a, b): Up to seven individuals recorded on the campus of Fukien Christian University, Fuzhou in a summer bird survey, June–August 1936 and at Changle around the same time.

Cheng (1941a, b): Recorded in summer and winter on the river south of Shaowu including a total of 24 individuals counted, 26–28 August 1940.

Specimens:

Xiamen (two), April 1860 (RMNH); Xiamen, April 1861 (BMNH); Fuzhou, 15 December 1895, February 1896, December 1896, 20 January 1913, December 1913 (three) (MCZ); unknown locality (two), 1903–1909 (Martens 1910); Fuzhou, December 1928 (Kuroda 1929); Shaowu, 24 June 1937 (Jordans & Niethammer 1940).

Gansu

Abundance/distribution:

Cheng (1987): Recorded in the southern part of the province.

Guangdong, Hong Kong and Macau

Abundance/distribution:

Swinhoe (1861a): 'Common [in Guangzhou, Hong Kong and Macau in February–May 1860]'.

La Touche (1892) 'Common and resident [at Shantou in the late 1880s]'. Streich (1903): A common resident at Shantou in the period 1889–1902. Kershaw (1904): 'Very common and resident [in the Hong Kong-Macao area in the early 1900s]'.

Vaughan & Jones (1913): 'A common bird throughout the districts treated in this article [Hong Kong, Macau, the Pearl River Delta, the North River north to Shaoguan and the West River from the Pearl River Delta through western Guangdong to Guixian in central Guangxi in 1900–1908] ... never found far away from water, either salt or fresh ... during the winter months selects certain favoured roosting-places ... and to these, at the close of day, large numbers may be seen winging their way from the feeding-grounds'.

Mell (1922): 'Resident, probably common throughout the province'. Yen (1930): 'Much more common [in northern Guangdong in 1930–1931]

than the preceding species [C. macrorhynchus]'. Jabouille (1935): 'Much more common [in Zhanjiang in 1932–1933] than the preceding species [C. macrorhynchus]'

Gressit (1940): One on the Lingnan College campus [now Sun Yat-sen University], Guangzhou in winter 1939/1940.

Zhou et al. (1981): In the Dinghu Shan area, Zhaoqing 1959–1966.

Liao (1982): In the Dinghu Shan area in 1979–1980 in similar numbers to previous years.

Guan *et al.* (1986): Breeding on Sanzao Island in the Pearl River Delta in 1980–1981.

Sun *et al.* (2003): Recorded from Nan'ao Island with counts of up to 3 between 14–17 June 2001.

Zou & Ye (2016): Listed from the prefectures/cities of Guangzhou, Shaoguan, Shenzhen, Zhuhai, Shantou, Zhaoqing, Huizhou, Meijiang River, Heyuan, Yangjiang, Qingyuan and Yunfu. Specimens:

Naozhou Island, 2 February 1868 (Swinhoe 1870); Macau, 14 March 1902 (NHMUK); 'Nam Long' [untraced locality on North River], 22 March 1905 (NHMUK); Fengwan, 3 April 1916, Xiaokeng, 5 February 1917 (ZMB); northern Guangdong (three), 19 March 1930, 8 January 1931 (Yen 1930); Zhanjiang (three), 1 and 12 May 1932 (Jabouille 1935); Lianshan, Yangshan, Lianping, Qieyang, Lufeng, Chao'an, Chenghai and Guangzhou, late 1950s–early 1960s (SCIEA 1991).

Guangxi

Abundance/distribution:

Vaughan & Jones (1913): 'A common bird [along the West River from Wuzhou to Guixian in the early 1900s]'.

Yen (1930) 'A common resident up to 250m [at Yao Shan]'.

Yen (1933–1934) 'Sedentary [in central and eastern Guangxi] and even more common than the preceding species [C. macrorhynchus]'. *Specimens*:

Pingnan, 20 April 1931 (Yen 1933–1934).

Guizhou

Abundance/distribution:

Wu *et al.* (1986): Flocks of several tens encountered in the vicinity of villages and farmland (300–2,400 m) in winter and spring in 1963–1982, and a nest containing two young birds found at Longlixian on 28 April 1981. *Specimens*:

Yinjiang, 25 April 1964, Xingyi, 23 October 1974, Chishui, 24 April 1975, Zunyi, 20 May 1975, Suiyang, 8 and 13 December 1976, Guiding, 18 November 1977, Jiangkou, 15 March 1978, Xifeng, 7 December 1978 (Wu *et al.* 1986).

Hainan

Last recorded 1963.

Abundance/distribution:

Swinhoe (1870): 'In the plains of the north and north-west of Hainan this bird frequently occurs ... it is evident that they are early breeders in Hainan as in South China'.

Ogilvie-Grant (1900): Seen at Haikou, 5–9 March 1899 per John Whitehead's diary.

Specimens:

Haikou (three), February/March 1868 (Swinhoe 1870); Haikou, 1890 or 1891 (Hartlaub 1892); Haikou (10), February–April, November–December 1902, Ledong, 11 March 1903, Utoshi, 21 March 1903 (Hartert 1910); Haikou, 20 January 1920 (Kuroda 1921); Wenchang, January, February and June in the late 1950s or early 1960s (Cheng & Tan 1973); Wanning, 31 May 1960, Lingshui, 7 and 13 February 1963 (South China Institute of Endangered Animals collection, Guangzhou, China).

Hebei

Abundance/distribution:

Wilder & Hubbard (1924): 'Fairly common resident throughout the province, but less common at the seashore and in the mountains. It also seems less common in summer than at other seasons. Lays in April and May'.

Specimens:

Xian and Hejian in the 1920s or 1930s (Seys & Licent 1933–1934 in Hemmingsen & Guildal 1968).

Henan

Abundance/distribution:

Fu (1937): 'Sedentary and common on the plain [in the years 1931–1934]'.

Hubei

Abundance/distribution:

La Touche (1922):'A common resident [at Shashi in the years 1917–1919]'. *Specimens*:

Yichang, October or November 1880 (Slater 1882); Yichang 10 October (three) and 31 October 1907, 'Chang Koo Hsien' [untraced locality in western Hubei], 3 February 1908 (MCZ).

Hunan

Specimens:

Dongting Lake, 21 November 1898 (Ogilvie-Grant 1900); Changde, 24 and 26 October, Hengshan, 4 April, Liling, 9 June, Leiyang, 27 November, Zixing, 13 November, Yizhang, 9 November in 1955 and 1957 (Cheng *et al.* 1960–1961).

Jiangxi

Abundance/distribution: Presumably recorded in the north of the province by Styan (1891).

Jiangsu

Abundance/distribution:

La Touche (1906–1907): 'A very common resident [at Zhenjiang in the early 1900s]'.

Koltoff (1932): 'Common [in Jiangsu south of the Yangtse River in 1921– 1922]; not so common north of the river'. The author also reported the progress of 31 pairs nesting in the plains and hills near Zhenjiang and mentioned another pair at Suzhou.

Ascherson (1930): 'Very common [at Nanjing in April-May 1930]'.

Chang (1932): 'One of the common crows [in the vicinity of Nanjing, 1931–1932]'

Chong (1938): 'One of the common residents [in Nanjing, 1925–1936]'. Specimens:

Nanjing, 25 October 1923 (MCZ), Nanjing (ten), unknown dates 1925–1936 (Chong 1938).

Shaanxi

Abundance/distribution:

Cheng *et al.* (1962): Up to 12 birds encountered in a single day in the Qinling mountains in April–July, 1957–1958.

Specimens: Yang Xian, Zhanba, unknown dates in 1957–1958 (Cheng et al. 1962).

Shandong

Abundance/distribution:

LeFevre (1962): 'Most numerous in western Shantung [1923–1927]. They decrease in numbers as one goes from Tsinan [Qinan] towards Tsingtao [Qingdao], so that as one reaches the central part of the province, one rarely sees them ... during the winter they can be seen in numbers at Tsinan ... a bird of the plain'. The author also reported a pair seen at Weishan on 16–17 and 26 January 1925, seven seen by George Wilder at Dexian on 14 April 1935 and two at Ling Xian on 26 April 1936. Specimens:

Laiyang, 5 May 1909, Qinan, 30 June 1911, Jimo, 11 October 1912, 'Hsingtsunchai' (untraced locality in eastern Shandong), 27 June 1937 (LeFevre 1962).

Shanghai

Abundance/distribution:

Sowerby (1943): 'A permanent resident ... may occasionally be seen passing over city and suburban districts of Shanghai [between the 1920s and early 1940s], but is not very plentiful ... Two were seen by me in the Western District this spring (1943), being joined later in the summer by four young ones'.

Li et al. (1959): Recorded in all months during surveys, 1951–1959. *Specimens*:

28 January 1884 (NHMUK); unknown dates prior to 1943 (Sowerby 1943).

Shanxi

Abundance/distribution:

Cheng (1987): Recorded in the southern part of the province.

Sichuan

Abundance/distribution:

David (1871): Occurs in Sichuan.

Dye (1969): Sightings of 20–30 individuals near the West China Union University campus, Chengdu in the 1920s and 1930s, but numbers down in the 1940s likely as a result of engineering works on the river. Cheng (1987): Recorded at Kangding.

Specimens:

Washan, 6 November 1908 (MCZ); Mingshan, 7 May 1931, near Emei Shan, 23 November 1931 (Traylor 1967); Yaan (five) and Chengdu, July–August 1934 (Schäfer & de Schauensee 1938); Emei Shan (four) March–June in 1957–1960 (Cheng *et al.* 1963); Maowen, May 1961 (Cheng *et al.* 1965); Baoxing (850–2,300 m), March–May, September, December 1962–1965 (Li *et al.* 1976).

Tianjin

Specimens:

Tianjin, 1920s or 1930s (Seys & Licent 1933–1934 in Hemmingsen & Guildal 1968).

Yunnan

Abundance/distribution:

Yang & Yang (2004): Recorded at Kunming and Yongshan (760–2,100 m).

Zhejiang

Moffett & Gee (1913): At Jiangyin, Hangzhou and Mogan Shan on unknown dates prior to 1913.

Gayot (1922): Recorded on six visits to the Haining area in December, February and March, 1917–1920.

Shaw (1934): 'A permanent resident of the plain and foothills [in the early 1930s] ... single birds or small flocks often met with'. *Specimens*:

Hangzhou, 16 October 1931, Wenzhou, 24 July 1932 (Shaw 1934).

Distribution in Taiwan

Abundance/distribution:

There are only three records from mainland Taiwan, all in the period 1979–1987: at Taichung on 10 October 1979 and 7 August 1981 and at Nantou on 8 August 1987 (Wang *et al.* 1991, Severinghaus *et al.* 2012). It is/was essentially restricted to Kinmen Island, where up to 176 individuals were recorded in 1989, but it has declined significantly since then (BirdLife International 2016).

Appendix 2.

Collared Crow records in China, Taiwan and Vietnam, 2003–2014.
